Programme Performance and Audience Engagement

Viewership analysis | March–May 2025

Executive summary

This report examines programme performance and audience viewing activity over a three-month period. The workflow combines monthly records, standardises programme titles using a master lookup reference, and applies regular-expression-based title extraction where a lookup title is unavailable. The prepared data is used to compare programme-level views, monthly totals, and daily viewing patterns.

The analysis identifies the highest-viewed programme, differences in monthly totals, and fluctuations in daily view counts. These findings describe patterns in the available data; they do not establish the causes of those patterns.

238,138	1.55M+	3 months
Views for Bradley Walsh	March 2025 views	March–May 2025

Data preparation approach

- **Combine monthly records:** consolidate March, April, and May viewership data into a single dataset.
- **Standardise programme titles:** match content codes against a master lookup table.
- **Handle unmatched records:** use regular-expression-based extraction from content names when a lookup title is unavailable.
- **Retain analysis fields:** date, views, publisher, and cleaned programme title.

Analysis scope

The analysis compares total views by programme, total views by month, and the daily time-series pattern across the period. The report focuses on descriptive findings and identifies follow-up questions that could be investigated with additional data.

Key findings

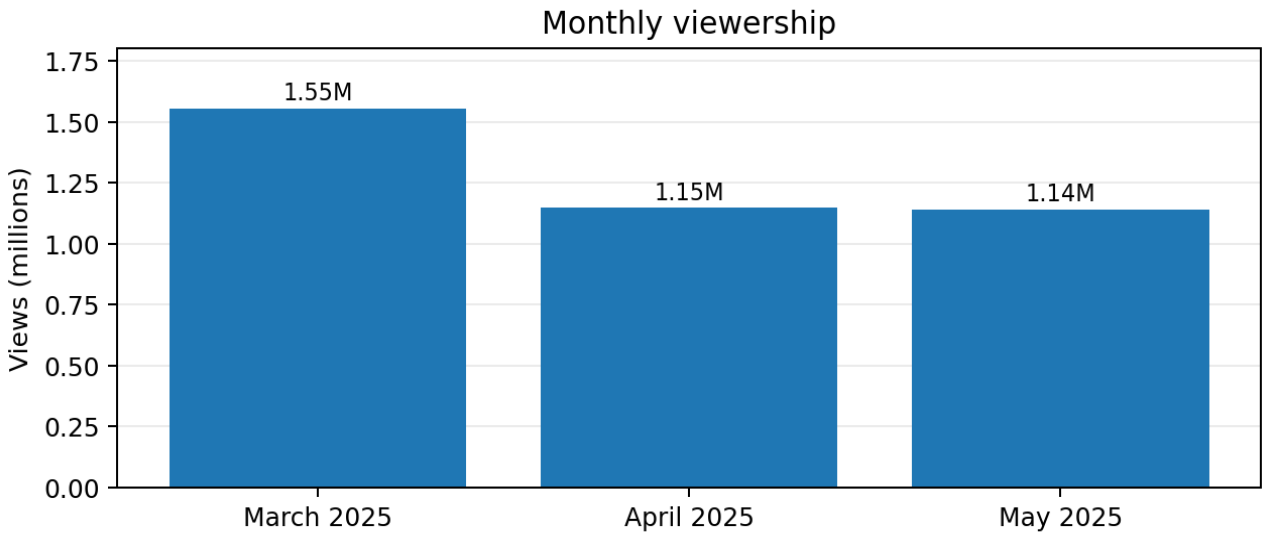

1. Programme-level performance

Bradley Walsh recorded 238,138 views, the highest total among the listed programmes. Other highly viewed titles included Gypsy Rose (215,645), Ancient Aliens (184,444), and Ramses (111,065). The top-ten results also included The Curse of Oak Island, Cops Gone Bad with Will Mellor, Homicide Hunter, Pawn Stars, Storage Wars, and The First 48.

Programme	Views
Bradley Walsh	238,138
Gypsy Rose	215,645
Ancient Aliens	184,444
Ramses	111,065
The Curse of Oak Island	88,343
Cops Gone Bad with Will Mellor	78,319
Homicide Hunter	76,268
Pawn Stars	75,526
Storage Wars	66,853
The First 48	62,851

2. Monthly viewership

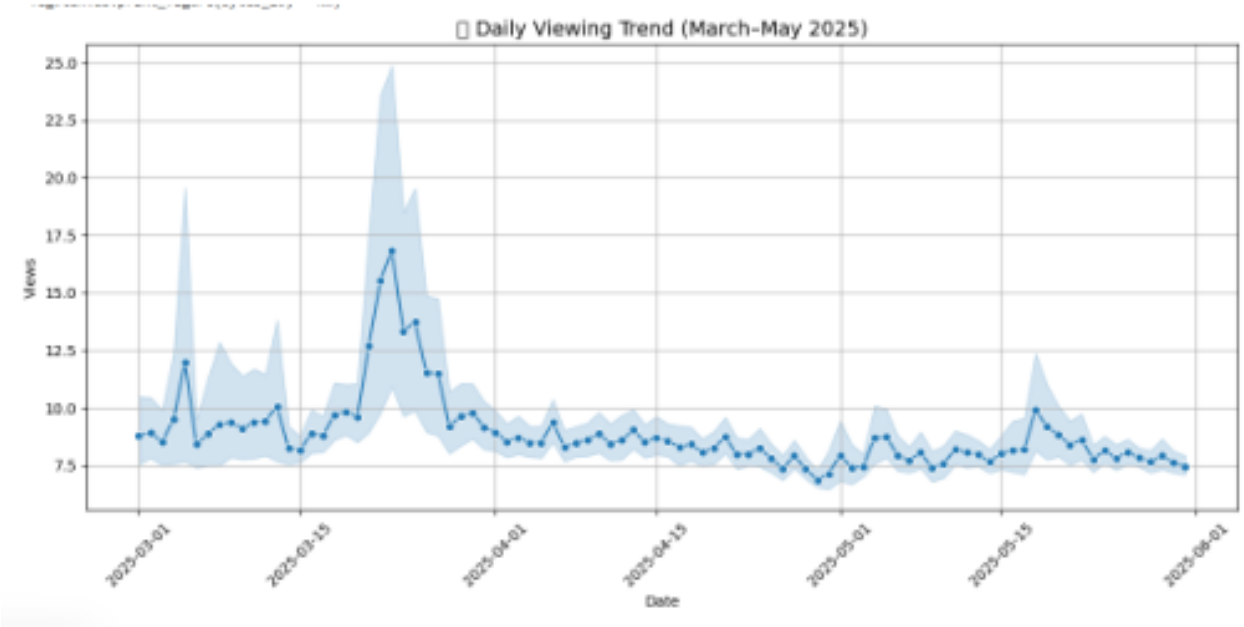

March 2025 recorded 1,553,854 views. April recorded 1,146,918 and May recorded 1,140,700. This represents a marked decline from March, while April and May totals were similar.

Monthly totals shown above are taken from the source report's monthly summary table.

3. Daily viewing pattern

The time-series chart shows a prominent peak in March, particularly around the middle of the month, followed by lower and comparatively stable daily view counts through April and May. Smaller spikes remain visible during the later period.

The time-series chart is reproduced from the original analysis so that the plotted pattern is preserved. The report's source chart shows daily view-count values and a shaded variation band.

Interpretation

The daily pattern identifies when view counts were higher or lower, but it does not by itself establish why. Content releases, campaigns, weekends, seasonality, or other factors could be investigated only if relevant supporting data is available.

Overall observations

- Bradley Walsh had the highest programme-level view count in the reported ranking.
- March had the highest monthly total, with April and May at similar lower levels.
- Daily view counts fluctuated, with the most prominent peak occurring in March.
- The programme ranking suggests that view counts varied considerably across titles; additional calculations would be needed to quantify the concentration of views across the full catalogue.

Summary and strategic recommendations

The analysis provides a descriptive view of programme performance from March to May 2025. The strongest reported programme-level result was 238,138 views for Bradley Walsh. Monthly totals were highest in March, then lower in April and May, while the daily series showed a pronounced March peak and smaller fluctuations later in the period.

Recommendations for further analysis

Review leading programmes over time

Compare weekly or monthly views for leading programmes to determine whether strong performance is sustained.

Evaluate promotional placement

Consider reviewing how high-viewed programmes are featured or promoted, then measure whether changes are associated with subsequent view counts.

Compare with release and scheduling data

If release dates, episode schedules, or campaign data are available, compare them with daily peaks to investigate possible relationships.

Monitor monthly changes

Extend the analysis across additional months to determine whether the observed March-to-April decline persists.

Measure viewership concentration

Calculate the share of total views contributed by the top programmes and compare it with the rest of the catalogue.

Validate title matching

Review unmatched content codes and extracted titles to check that programme names have been standardised consistently.

> **Interpretation note**
> Potential explanations such as content drops, campaigns, seasonality, or weekend viewing should be treated as hypotheses, not confirmed causes, unless corroborated with supporting data.
